NAME

xzmore, lzmore − view xz or lzma compressed (text) files

SYNOPSIS

xzmore [*file...*]
lzmore [*file...*]

DESCRIPTION

xzmore is a filter which allows examination of **xz**(1) or **lzma**(1) compressed text files one screenful at a time on a soft-copy terminal.

To use a pager other than the default **more,** set environment variable **PAGER** to the name of the desired program. The name **lzmore** is provided for backward compatibility with LZMA Utils.

e or **q** When the prompt −−More−−(Next file: *file*) is printed, this command causes **xzmore** to exit.

s When the prompt −−More−−(Next file: *file*) is printed, this command causes **xzmore** to skip the next file and continue.

For list of keyboard commands supported while actually viewing the content of a file, refer to manual of the pager you use, usually **more**(1).
